

Abstract

The invention is based on a wiper strip (18) for windshield wipers having a profile spine (20) and a functional part (22) that is connected to the profile spine (20) via a tilting bridge piece (26) and that bears against it in the tilted position.

It is proposed that the functional part (22) include a supporting section (30) that is connected to the profile spine (20) via the first tilting bridge piece (26) and to a wiper wedge (32) via a second tilting bridge piece (28).
